

NEW CF50 ONBOARD PC FROM DIGITAL YACHT

Digital Yacht, the Bristol-based manufacturer of marine PCs and IT products, has recently launched its new ultra-compact CF50 Series. Measuring just 255mm x 165mm x 70mm, it claims to be one of the most compact PC systems in the world. Unlike many other compact PCs, it uses a genuine Intel M processor for ultra-reliable and powerful computing, and is designed to work with Windows operating systems.

The CF50 is ideal for onboard electronic charting applications, navigation and communication requirements, and has a fast graphics processor for quick redraws of electronic charts. It also features a combination DVD and CDRW drive for playback of movies or recording information to CD. Interfaces include a traditional serial interface for NMEA interfacing, USB, LAN and FAWA connections to suit most onboard connectivity requirements. The system is powered directly from the boat's 12V DC system without the need for a separate inverter or external power supply. It also features a traditional VGA output for connection to a wide range of LCD monitors available separately or from third parties.

The CF50 carries a special introductory price of £699.00 inc VAT. Various bundles are available with pre-loaded electronic charting packages including Nobeltec, Maxsea, SeaPro and Maptech, with pricing starting from £799.00 inc VAT.
